#### Part 4: Short Talk Questions

*Listen to the following paragraph and answer the questions.*

Hand warmers are useful when the weather gets cold. But how do they create heat without electricity? The answer is through oxidation, which is a reaction that releases heat when rust forms on an iron powder. Hand warmers contain four main ingredients that make oxidation take place: iron powder, salt, water, and activated carbon. The final ingredient, oxygen, is added when the hand warmer comes into contact with air. Shaking a hand warmer allows more oxygen to enter, so it heats up more quickly. To make your hand warmer last longer, keep it in a plastic bag. This cuts it off from its oxygen supply, preventing the chemical reaction from taking place when it's not in use. (1 Unit 3) #A

- (D) 7. What is oxidation?  
 (A) An ingredient that hand warmers contain.  
 (B) A chemical used in hand warmers.  
 (C) A reaction that creates oxygen.  
 (D) A reaction that creates heat.
- (B) 8. How do you make a hand warmer last longer?  
 (A) Put it in an open box.  
 (B) Put it in a plastic bag.  
 (C) Place it in a warm, dry place.  
 (D) Allow more oxygen to go in it.
